Forecast Discussion

NWS Detroit/Pontiac · 1138 AM EST Wed Nov 4 2026

- Mild still today with light rain showers around for much of the day.

- Briefly drier to start Thursday before scattered shower return late Thursday-Friday.

- Temperatures return to normal values to end the week.

&&

.AVIATION...

A plume of deep layer moisture will continue to lift across Se Mi this afternoon in advance of a cold front. Area observations indicate widespread MVFR ceilings likely to prevail into the early evening. There have been observations showing IFR ceilings along a secondary low level moisture influx just to the southwest of the terminals, which may lead to some intervals of IFR ceilings this afternoon. There will likely be fluctuations in the frequency of wind gusts over 20kt this afternoon. The southerly gradient flow will sustain 30 knot winds down to 2k feet. A shallow near surface stable layer will suppress gusts at the surface periodically. The cold front will progress across Se Mi between 02Z and 03Z this evening, causing a wind shift to the southwest. Post frontal cold air advection will support increasing chances for ceiling heights to rise to VFR within the post frontal environment.

For DTW...Current trends and available guidance suggest ceilings below 2000 feet through the afternoon into the evening. A wind shift from SSW to SW associated with the cold front is forecast between 02Z and 03Z this evening. While ceilings are forecast to rise post frontal passage, current model guidance suggest they will remain aob 5000 feet into the overnight.

.DTW THRESHOLD PROBABILITIES...

* High for ceiling 5000 ft or less today. Medium tonight and Thursday morning.
