Forecast Discussion

NWS Detroit/Pontiac · 755 PM EDT Thu Oct 15 2026

- Showers expand in coverage and intensity overnight.

- A cold front delivers gusty winds (+35 mph) and chillier conditions Friday, with periods of showers.

- Frost/freeze conditions are possible Friday night into Saturday morning with temperatures minimizing in the low 30s.

- Turning drier over the weekend and through the first half of next week with a gradual warm-up starting Sunday.

&&

.AVIATION...

Surface low pressure is analyzed roughly 80 miles west-southwest of KORD at issuance and will lift northeast through the course of the night. For now, this has maintained a broad plume of MVFR stratus at all terminal sites with vsby restrictions confined to the northern portions of the airspace. Expectation however is for upstream IFR cigs/vsbys to move in tandem with the low pressure center and reach the airspace late this evening-overnight (between 02z-05z). Have not seen any lightning so far with accompanying shower activity, but there will be a brief opportunity for a few hundred J/kg of MUCAPE to lift into southern portions of the airspace between about 03z and 08z tonight. An isolated thunderstorm cannot be ruled out, but affords very low confidence in impacting any one terminal site. Once the surface low passes through around 06z, winds quickly shift to the southwest and become gusty amidst a strong low level jet. Forecast soundings show the boundary layer to be fairly well-mixed, favoring gusty 20-25 knot SW winds rather than materializing as low level wind shear. Gradual improvement in ceilings expected through Friday, but will be challenged by lake moisture as winds veer to the northwest throughout the daytime hours.

D21/DTW Convection...Very low probability for an isolated thunderstorm to develop before 08z.

.DTW THRESHOLD PROBABILITIES...

* High for ceilings at or below 5,000 feet through the TAF period.

* Low for thunder through 08z.
