Forecast Discussion

NWS Detroit/Pontiac · 657 PM EDT Thu Oct 22 2026

- The potential exists for dense fog development each of the daybreak periods Friday through Monday. Any fog that will develop is expected to dissipate or lift by 10 am.

- Mild and dry through the middle of next week.

&&

.AVIATION...

High pressure will maintain residence throughout the region this period as it settles into Quebec. Associated veering of wind toward the northeast and then east with time through Friday morning will set the stage for some degree of low level moisture advection off the upstream lakes tonight. Evidence of this already underway across Sagainw Bay in the form of lower stratus, suggesting a high likelihood for fog/low stratus expansion into portions of central and southeast Michigan throughout the night. Forecast will continue to highlight a window for IFR to LIFR conditions to emerge during the early morning hours. Potential does exist for a period of dense fog to develop, with visibility below 1/4 mile. A gradual improvement in conditions late morning as daytime heating works to lift and clear any lingering low stratus and fog. VFR conditions with a limited diurnal cu production for the remainder of Friday.

D21/DTW Convection... Thunderstorms are not forecast through the TAF period.

.DTW THRESHOLD PROBABILITIES...

* Low for cigs/vsby to fall below 200 ft and/or 1/2SM.
