.AVIATION...

A mix of MVFR to the north and VFR across the south will start this TAF period as shower coverage has decreased for now aside from a brief period across FNT for the next hour or two. Cold northerly flow and increased lift with multiple waves within the broader troughing over the region will lead to a robust lake response with models pointing to two dominate lake bands starting late tonight and through much of tomorrow afternoon. One band develops off of southern Lake Huron with the other one off Saginaw Bay. This puts FNT and DET with the higher likelihood to be most impacted downstream of these two lake bands. It may be cold enough at FNT for a more prevailing snow p-type for much of today with DET warm enough for more of a mix of rain and snow. Robust lake response will also maintain a MVFR ceilings with pockets of IFR conditions possible if any heavier lake band manage to reach these terminals. Expecting to see potential for scattered rain/snow showers across other terminals as well. Shifting lower level winds towards the northwest late tomorrow afternoon will begin to direct lake bands east of the terminal corridor with some improvement in ceilings possible by tomorrow evening. Winds holding out of the north to around 10 knots.

For DTW... Recent radar trends lean towards a break from precipitation to start this TAF period before the main lake effect bands fully form later this morning. The more dominant band looks to set up closer towards DET. However, pieces of this activity could break off and reach DTW. This would be more focused late morning and early afternoon. Temperatures would be warm enough to support a rain-snow mix in this outcome with minimal if any accumulation.

.DTW THRESHOLD PROBABILITIES...

* High for ceilings at or below 5,000 feet through tomorrow afternoon.

* High for p-type as rain through 06z tonight. Medium for rain-snow with any precip after 06z into tomorrow afternoon.
