.AVIATION...

Approaching mid level moisture influx within weak elevated instability is driving ongoing convective development across western Lower Mi. The gradual advection of this mid level moisture and presence of elevated instability will sustain a chance of showers and isolated thunderstorms through the night. A cold front approaching MBS during the night and better elevated forcing will support higher shower chances at MBS. The pace of upstream development suggest convective chances may arrive mid to late evening at MBS. Trailing mid level moisture/instability axis farther south supports higher showers/thunderstorm chances remaining later into the overnight at the metro Detroit terminals. Drier air will advect across the area within a tightening west-southwest gradient on Tuesday. Despite relatively shallow mixing depths, model soundings and probability guidance supports frequent gusts in the 25 to 30 knot range Tues afternoon.

D21/DTW Convection... The better mid level moisture axis will traverse metro Detroit overnight into the pre dawn hours on Tuesday. A chance of showers will be maintained in the forecast in the 07Z to 11Z time frame. While isolated thunderstorms are possible across the airspace, the chances for thunderstorems at metro airport is under 30 percent.

.DTW THRESHOLD PROBABILITIES...

* Low for thunderstorms overnight into early Tuesday morning.
