Forecast Discussion

NWS Detroit/Pontiac · 1238 PM EST Fri Nov 13 2026

- Showers steadily shift offshore tonight and Saturday, then turning drier and warm next week.

&&

.AVIATION...

Mostly MVFR cigs with very light rain and melting snow downwind of Lake Huron across most of southeast Michigan early this afternoon. Weak surface ridging building into southern Lower Michigan early this evening is expected to support low level drying as winds shift a touch more out of northwest, confining lake effect activity to the Thumb region tonight. Thus, partial clearing and VFR ceilings are expected this evening into tonight at all taf sites. Prolonged low level northwest flow should eventually result into borderline MVFR/VFR stratus tomorrow morning, though exact timing remains uncertain. Once the low clouds return, they should remain locked in through the day tomorrow.

For DTW...Light rain showers with embedded melting snow this afternoon will dissipate by early this evening as low levels dry out and partial clearing takes place. It is possible a leftover VFR ceiling 3000-5000 ft lingers this evening into tonight, but confidence is low. Low clouds will likely hold off until tomorrow morning (between 11 and 15z) before returning.

.DTW THRESHOLD PROBABILITIES...

* High for ceilings at or below 5,000 feet this afternoon, low this evening and tonight, high tomorrow.

* Medium for light rain/melting snow mix this afternoon.
