BOTTOM LINE · OPERATIONAL IMPACTS, NEXT 48H+

RAIN	**Rain windows ≥30%: Fri 8 AM, Sat 2 AM** Peak 67% at Fri 10 PM. Amounts < 0.1 in. Protect open panels/terminations and stored gear.	WATCH
WIND	**Gusts to 25 mph (Friday Night)** Sustained up to 13 mph NW. Secure ladders, sheet goods and roof-top work; high-profile vehicles fine below ~40 mph.	WATCH
HEAT	**Unseasonably warm: 50°F peak (Sat 3 PM)** Dewpoints ~34°F. Hydrate in attics/mech rooms and lifts.	NOTE
TEMP DROP	**48h low 32°F · 7-day low 29°F (Saturday Night)** Frost/freeze-level lows in the 7-day. Watch freeze-sensitive equipment, outdoor startups, coil freeze stats.	PLAN
TRAVEL	**No hazardous weather expected (HWO)** Roads: wet pavement only during rain windows above.	CLEAR

HAZARDOUS WX OUTLOOK — NONE

Today/Tonight: No hazardous weather is expected at this time.
Days 2–7: No hazardous weather is expected at this time.

KEY — **Dry weather helps temperatures rise a few degrees above normal again during the weekend and early next week.** — NWS DTX

CLIMATE NOTE

NOTE

A deep upper low is advancing across Lower MI this morning with an impressive presentation to the closed circulation noted in satellite WV imagery. Fgen associated with the aggressive height falls and PVA exits to the east over the next hour with a surge of dry air aloft quickly working in from the northwest. This brings an end to the light to moderate rainfall, with a lull in precip until mid morning when deeper moisture sweeps back across the area. Cool northwest wind with pockets of lake enhanced light rain and/or drizzle bring a raw, grungy day with temperatures to struggling to reach 50 degrees this afternoon. As the deep cyclonic circulation passes overhead, a surface mesolow is forecast to drop across Lake Huron this afternoon and evening. This brings a strongly forced mesoscale band of rain within the trowal/deformation axis into the vicinity of the eastern Thumb. Given the scale of forcing, placement of the heaviest rain carries uncertainty but confidence has increased for rainfall totals in excess of 0.50" from Port Austin to Port Hope and Harbor Beach. A small handful of hi-res solutions and individual members of ENS and GEPS ensembles indicate potential for localized areas to receive over 1 inch in the event the mesolow is slower to pass into the Ontario peninsula tonight. Surface temps in the 40s and wet bulb zero heights as low as 2000 ft offer high confidence in rain as the ptype. Light rain may linger into Saturday morning along the Thumb shoreline, otherwise negative vorticity advection ensues in the wake of the departing upper low to cease precip chances. Moist cyclonic flow below 800mb keeps a good amount of clouds around Saturday and thermal troughing helps hold high temps in the lower 50s. Shortwave ridging crests over the area Saturday night before the next trough arrives from the northwest on Sunday. This wave is also deep but more progressive, targeting Lake Huron with its main height fall corridor. Light rain may brush the Thumb, but the main impact locally will be a breezy westerly wind as the system passes to the north. Milder conditions develop Sunday into Tuesday as positive upper height anomalies prevail over the upper Midwest and Great Lakes. This period is generally devoid of organized forcing, favoring dry conditions. && .MARINE... Trough of low pressure remains stretched from Quebec southwestward through the central Great Lakes early this morning. An upper low drifting south overnight is causing the surface trough to close into a low over central Lake Huron this morning before the whole system drifts off to the south for the weekend. A trailing trough axis will get pulled through the area later today as well. Winds will be variable from lake to lake today with the circulation right over Huron. Lakes Erie and St Clair will remain in the northwesterly flow through the day with the track of the low, while northern Huron get into gusty northeasterly winds north of the low. The cold air advection is helping to increase mixing depths over the water and will help keep the winds speeds and waves elevated through this time across Lake Huron. This will all lead to an extended period of Small Craft Advisories across much of the waters now through Saturday morning. Will need to watch western Lake Erie tonight into Saturday morning for brief period of winds gusts to around 25 knots. && .PREV DISCUSSION... Issued at 1145 PM EST Thu Nov 5 2026 AVIATION... Strong absolute vorticity maximum will dig directly into Southeast Michigan between 06-15z Friday. Height falls and differential cyclonic vorticity advection is forecasted to result in an active low-midlevel frontogenesis axis directly over the forecast area between now and 09-11z, resulting in an increasing coverage of rain. This fgen will coincide with secondary cold front or dewpoint gradient that will result in another round of cold advection. Steepening lapse rates with saturation will result in MVFR or VFR stratocumulus Friday. Northwest wind Friday of 10 to 20 knots. DTW THRESHOLD PROBABILITIES... * High for ceiling 5000 ft or less tonight and Friday. && .DTX WATCHES/WARNINGS/ADVISORIES... MI...None. Lake Huron...Small Craft Advisory until 4 PM EST Saturday for LHZ421-441. Small Craft Advisory until 10 AM EST Saturday for LHZ422. Small Craft Advisory from 9 AM this morning to 4 PM EST Saturday for LHZ442-443. Lake St Clair...Small Craft Advisory from 10 PM this evening to 10 AM EST Saturday for LCZ460. Michigan waters of Lake Erie...None. && $$ DISCUSSION...TF MARINE.....DRK AVIATION.....CB You can obtain your latest National Weather Service forecasts online at www.weather.gov/detroit.
