KEY — **Light rain overspreads SE MI this afternoon and evening.** — NWS DTX

KEY — **A much colder airmass arrives Thursday, triggering gusty north wind and lake effect rain/snow showers Thursday through Saturday. Minor wet snow accumulations will be possible in the Thumb.** — NWS DTX

CLIMATE NOTE

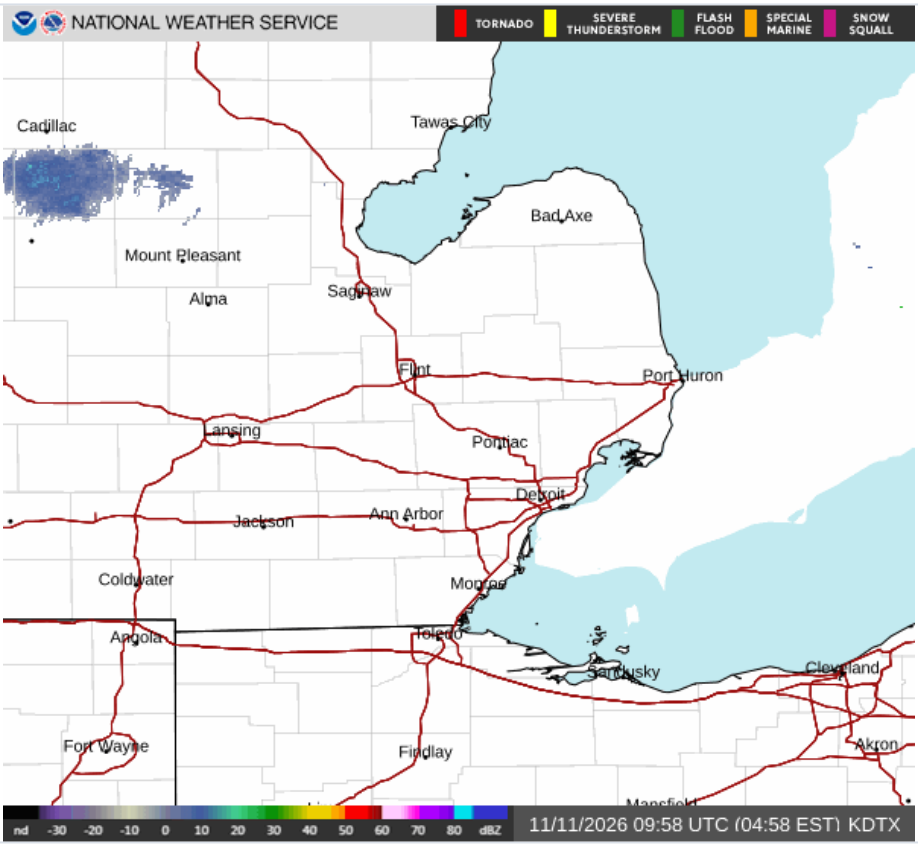

NOTE

Pseudo-zonal flow maintains benign conditions across the region this morning before a significant pattern shift arrives later today and carries through the late week. This shift is driven by a powerful Pacific jet streak working into western BC, causing downstream trough amplification from Hudson Bay all the way down to the Mid- Atlantic states. A shortwave embedded within NW flow over the Midwest first reaches the local area this evening with the attendant height falls and PVA ushering in deepening moisture with time. This brings a 40-60% chance of mainly light rain late afternoon and into this evening. A second shortwave originating from central Canada reaches the Great Lakes late this evening, marking the lead edge of an arctic air mass. As these two waves merge overhead, a deepening low will emerge east of the area and facilitate a period of prolonged northerly cold air advection Thursday into Saturday. The initial cold front is marked by an uptick in convective rain shower coverage and gusty northeast winds Thursday morning. This precip works through from north to south with a brief lull before the inbound cold air induces enough over-lake instability for lake effect showers to kick off. Prolonged NNE sfc-850mb flow maintained over Lake Huron allows a multi-band character to emerge Thursday evening, reaching peak strength Friday morning as the next spoke of PVA arrives within deep cyclonic flow wrapping around the sprawling upper low retrograding into the northern Great Lakes. These bands will be predisposed to set up over the western/central Thumb and far eastern Thumb, including the Port Huron vicinity. Daytime temperatures hold in the 40s on Thursday with rain the predominant p- type, then melting snow gradually takes over Thursday night into Friday. 850mb temps fall to around -6C Thursday night, setting up delta-T over the lake of nearly 20C. Model soundings highlight 400-700 J/kg of lake induced CAPE and impressive boundary layer omega supporting localized moderate to heavy precip rates where the bands ultimately set up through Friday morning. Despite the colder air and heavier rates, ambient dew points in the lower 30s and near record high water temperatures (mid to upper 50s F) in the Lake Huron southern basin will result in significant melting of hydrometeors. Immediate lakeshore areas stay mild enough to see nil snow accumulation, but just a few miles inland WBZ heights falling below 1000 ft will offer potential for pockets of wet accumulations on grassy surfaces to around 1" by noon Friday. This is supported by 70-80% probability for minor accumulations in NBM and REFS ensemble data. A small handful of individual ensemble members and operational model runs advertise extreme snowfall amounts but these appear to be driven by unrealistic SLRs given the anticipated thermal profile and warm ground. Synoptic flow backs to NNW Friday night, Saturday, and likely into Sunday which confines the lake effect banding to the northeastern Thumb. Elsewhere, subsidence maintains dry conditions and looks to eventually reduce coverage of lake effect clouds. The 850mb thermal trough keeps temps on the cool side of normal through the weekend - highs in the 40s and lows in the 20s/lower 30s. A period of rebounding heights ensues early next week as the longwave trough releases eastward. This favors dry and stable conditions with a gradual warming trend. && .MARINE... High pressure influence gradually exits the central Great Lakes today with weak/variable flow while the next low pressure system deepens and takes aim at the Ohio Valley. Winds pick up considerably over the waterways tonight as the system moves east. Expect modest- strong north-northeasterly flow, with a heightened wind and wave response. Latest model data continues to advertise a brief period of gusts to near gales Thursday morning for portions of Lake Huron, but still looks marginal enough to preclude any gale-related headlines. Small Craft Advisories are in effect for all nearshore waters for Thursday. Persistent troughing keeps winds elevated Friday, albeit with even lower chances for gales. Extensions will likely be needed for some of the small crafts, depending on how long the constricted gradient holds on. Potential exists for a waterspout or two during this time-frame as shower activity arises. && .PREV DISCUSSION... Issued at 1220 AM EST Wed Nov 11 2026 AVIATION... High pressure will lead to light to variable winds through the rest of tonight. Not anticipating much fog, if any, given the dry resident airmass. The inbound increasing coverage of high clouds will also help limit radiative cooling during the early morning hours. Winds become N-NE by late this morning/early afternoon with OVC mid-high clouds. A reduction in ceiling heights will occur late this afternoon into the evening along with increasing rain chances as a low pressure system takes shape across the Midwest and moves into the Ohio Valley. Ceilings by this evening will be down to MVFR and IFR. DTW THRESHOLD PROBABILITIES... * Medium for ceilings at or below 5,000 feet late this afternoon. High this evening into tonight. && .DTX WATCHES/WARNINGS/ADVISORIES... MI...None. Lake Huron...Small Craft Advisory from 1 AM to 10 PM EST Thursday for LHZ421-422- 441. NWS PERIOD DETAIL

PERIOD	TEMP	DETAIL
Overnight	**38°F**	Mostly cloudy, with a low around 38. South wind around 2 mph.
Veterans Day	**53°F**	A chance of rain after 2pm. Cloudy. High near 53, with temperatures falling to around 49 in the afternoon. West northwest wind 2 to 6 mph. Chance of precipitation is 30%. New rainfall amounts less than a tenth of an inch possible.
Wednesday Night	**40°F**	A chance of rain. Cloudy, with a low around 40. North wind 2 to 9 mph. Chance of precipitation is 50%. New rainfall amounts between a tenth and quarter of an inch possible.
Thursday	**43°F**	A chance of rain before 3pm. Cloudy, with a high near 43. North wind 10 to 16 mph, with gusts as high as 26 mph. Chance of precipitation is 50%. New rainfall amounts between a tenth and quarter of an inch possible.
Thursday Night	**32°F**	A slight chance of rain before 7pm, then a slight chance of snow between 7pm and 1am. Mostly cloudy, with a low around 32. North northwest wind 8 to 14 mph, with gusts as high as 24 mph. Little or no snow accumulation expected.
Friday	**40°F**	Cloudy, with a high near 40.
Friday Night	**28°F**	Partly cloudy, with a low around 28.
Saturday	**43°F**	Mostly sunny, with a high near 43.
Saturday Night	**29°F**	Partly cloudy, with a low around 29.
Sunday	**45°F**	Partly sunny, with a high near 45.
Sunday Night	**29°F**	Mostly cloudy, with a low around 29.
Monday	**46°F**	Partly sunny, with a high near 46.
Monday Night	**29°F**	Partly cloudy, with a low around 29.
Tuesday	**49°F**	Mostly sunny, with a high near 49.

.DISCUSSION...

Pseudo-zonal flow maintains benign conditions across the region this morning before a significant pattern shift arrives later today and carries through the late week. This shift is driven by a powerful Pacific jet streak working into western BC, causing downstream trough amplification from Hudson Bay all the way down to the Mid-Atlantic states. A shortwave embedded within NW flow over the Midwest first reaches the local area this evening with the attendant height falls and PVA ushering in deepening moisture with time. This brings a 40-60% chance of mainly light rain late afternoon and into this evening. A second shortwave originating from central Canada reaches the Great Lakes late this evening, marking the lead edge of an arctic air mass. As these two waves merge overhead, a deepening low will emerge east of the area and facilitate a period of prolonged northerly cold air advection Thursday into Saturday.

The initial cold front is marked by an uptick in convective rain shower coverage and gusty northeast winds Thursday morning. This precip works through from north to south with a brief lull before the inbound cold air induces enough over-lake instability for lake effect showers to kick off. Prolonged NNE sfc-850mb flow maintained over Lake Huron allows a multi-band character to emerge Thursday evening, reaching peak strength Friday morning as the next spoke of PVA arrives within deep cyclonic flow wrapping around the sprawling upper low retrograding into the northern Great Lakes. These bands will be predisposed to set up over the western/central Thumb and far eastern Thumb, including the Port Huron vicinity. Daytime temperatures hold in the 40s on Thursday with rain the predominant p-type, then melting snow gradually takes over Thursday night into Friday.

850mb temps fall to around -6C Thursday night, setting up delta-T over the lake of nearly 20C. Model soundings highlight 400-700 J/kg of lake induced CAPE and impressive boundary layer omega supporting localized moderate to heavy precip rates where the bands ultimately set up through Friday morning. Despite the colder air and heavier rates, ambient dew points in the lower 30s and near record high water temperatures (mid to upper 50s F) in the Lake Huron southern basin will result in significant melting of hydrometeors. Immediate lakeshore areas stay mild enough to see nil snow accumulation, but just a few miles inland WBZ heights falling below 1000 ft will offer potential for pockets of wet accumulations on grassy surfaces to around 1" by noon Friday. This is supported by 70-80% probability for minor accumulations in NBM and REFS ensemble data. A small handful of individual ensemble members and operational model runs advertise extreme snowfall amounts but these appear to be driven by unrealistic SLRs given the anticipated thermal profile and warm ground.

Synoptic flow backs to NNW Friday night, Saturday, and likely into Sunday which confines the lake effect banding to the northeastern Thumb. Elsewhere, subsidence maintains dry conditions and looks to eventually reduce coverage of lake effect clouds. The 850mb thermal trough keeps temps on the cool side of normal through the weekend - highs in the 40s and lows in the 20s/lower 30s. A period of rebounding heights ensues early next week as the longwave trough releases eastward. This favors dry and stable conditions with a gradual warming trend.

&&

.MARINE...

High pressure influence gradually exits the central Great Lakes today with weak/variable flow while the next low pressure system deepens and takes aim at the Ohio Valley. Winds pick up considerably over the waterways tonight as the system moves east. Expect modest-strong north-northeasterly flow, with a heightened wind and wave response. Latest model data continues to advertise a brief period of gusts to near gales Thursday morning for portions of Lake Huron, but still looks marginal enough to preclude any gale-related headlines. Small Craft Advisories are in effect for all nearshore waters for Thursday. Persistent troughing keeps winds elevated Friday, albeit with even lower chances for gales. Extensions will likely be needed for some of the small crafts, depending on how long the constricted gradient holds on. Potential exists for a waterspout or two during this time-frame as shower activity arises.
